

## **Notes from Brett:**

So, I'm still noodling on what setup does exactly. Perhaps we could add quantifiers for shelving lengths ect., to assist with the LED microcontroller. I'm thinking of a dynamic way to assist us with programming a variable instead of a constant for the length of a shelf that will then in turn, calculate the appropriate amount to tell the LEDs to travel.

This is all subject to change of course.

I'm also trying to think out the best way to build a virtual shelving environment. Perhaps one that could be looked at on a computer instead of a mobile device. I'm not really sure that is necessary or really beneficial.
